Running an application:

- 1. Switch to the z/OS Projects perspective.
- 2. Define a launch configuration that includes specific environment variables or input parameters for the executable file.
 - a. On the workbench toolbar, click the **Run** icon and select **Run**.
 - b. In the configurations list, click **Compiled Application**, then click the **New launch configuration** icon.
 - c. In the **Name** field, type a name for the launch configuration. This name is added to a list of options under a **Run With Configuration** menu. Choose a name that you can associate with the program, input parameters, and environment variable values that are defined in the launch configuration
 - On the Main tab, define the Project, Program name, and Program parameters in the respective fields.
 - On the **System Environment** tab, specify values for environment variables that the executable file queries at run time.
 - On the **Common** tab, define the type of launch configuration and the perspective you want to use for each launch mode.

- 3. Click **Apply** and **Close**.
- 4. Run the program.
 - . In the Projects view, find the executable file that you want to run.
 - a. Right-click the executable file and select Run With Configuration > (launch configuration name you defined previously).
